A strong cold front will track southwards across the Gulf of Mexico Saturday evening bringing enhanced winds and seas

Threat Time: 2100 UTC Saturday through 0000 UTC Monday

Primary Impacts:

Winds: 30 to 35 knots

Wind Shift: SW-WSW at 12-17 knots / NNW-NNE 25-35 knots

Wind Gusts: In excess of 45 knots

Seas: (Near Shore) 5-8 feet, (Deep Seas) 9-13 feet

A potent cold front will be making its way southwards across the Gulf of Mexico Saturday evening with this front forecast to begin to push offshore the Gulf states around 0000 UTC Saturday. As this frontal boundary tracks across the Gulf of Mexico west-southwest to southwesterly winds at moderate to fresh speeds will quickly shift to a north-northwest to northerly direction, eventually becoming north-northeasterly at strong to near gale force with gale force gusts. In addition to this strong wind shift seas will also build across the Gulf of Mexico to 9-13 feet across the deep waters of the Gulf and 5-8 feet near the shores. These enhanced conditions are forecast to persist into Sunday afternoon with seas falling below 10 feet around 2100 UTC Sunday, then seas will lower rapidly, falling below 7 feet by 0000 UTC Monday. In addition to the enhanced winds and waves showers and thunderstorms will likely be associated just out ahead and along the frontal boundary which may lead to some locally enhanced winds and waves as the frontal initially moves across the region.

A WDT Marine Weather Watch has been issued for Galveston Anchorage

Good Day,

Galveston Anchorage

WDT Marine Weather Watch, expires at Friday, November 17, 2017 3:00 pm CST
