**Gulf of Mexico Synopsis - December 10, 2017**

Moderate northwest winds across the basin will slightly decrease later this morning before beginning to shift out of the west. Westerly winds will spread from south to north across the Gulf ahead of a front that is pushing through the CONUS. By the late evening, most of the region will be experiencing westerly winds at moderate strengths, with the winds to increase from south to north Tuesday morning. The front is expected to enter the northern Gulf Tuesday mid-morning and continue southward throughout the day, spreading fresh to occasionally strong northerlies behind it. At this time, it appears this front will stay below significant wind shift criteria due to the gradual shift from west to northwest to north. The offshore Louisiana Delta area will likely see the most elevated conditions, where 20-25 knot winds and 6-8 foot seas will be possible for a short duration. Northerly winds will steadily weaken Tuesday into Wednesday across the basin. Model guidance is coming into agreement that a strong cold front will impact the GOM by the end of the week.

ECMWF surface winds, sea-level pressure, and 6-hour precipitation valid 1200 UTC December 11:

At this time, it appears this front will stay below significant wind shift criteria due to the gradual shift from west to northwest to north. The offshore Louisiana Delta area will likely see the most elevated conditions, where 20-25 knot winds and 6-8 foot seas will be possible for a short duration. Northerly winds will steadily weaken Tuesday into Wednesday across the basin. Model guidance is coming into agreement that a strong cold front will impact the GOM by the end of the week.
