Gulf of Mexico Synopsis - November 17, 2017

The primary weather concern for the Gulf will be a strong cold front that is forecast to impact the entire basin this weekend. Southerly winds will increase Saturday morning ahead of the approaching front and will shift out of the southwest prior to frontal passage. Model guidance is in general agreement that the front will reach the western Gulf around 0000 UTC Sunday and push through the basin by Sunday afternoon. A Significant Wind Shift is likely, as winds will shift abruptly out of the north to north-northeast at near-gale strength accompanied by widespread rough seas. Gusty showers may be possible along the front, and the potential exists for 50+ knot wind gusts. There are currently WDT Marine Watches active outlining in detail the primary impacts associated with the front. Winds will steadily turn and weaken out of the east by mid Monday morning as a high pressure builds across the eastern CONUS.

ECMWF surface winds, sea-level pressure, and 6-hour precipitation valid 1200 UTC November 17:

http://metgen-images.aws.wdtinc.com.s3.amazonaws.com/images/ehres/gom/2017111700/tp/2017111700_f12_gom_tp.gif
