#### **Gulf of Mexico Weather Synopsis - April 18, 2018**

Winds across the Gulf are forecast to be lessening today as the pressure gradient weakens across the region. High pressure will be sliding off to the east as low pressure across the Southern Plains moves towards the region. This low will cause a cold front to move into the basin overnight tonight into tomorrow morning, allowing winds to become northerly and begin to strengthen again. The extreme western Gulf near the coastline should see fresh to some strong winds, while the rest of the basin will experience moderate to fresh winds as this front pushes through. Winds will then remain around fresh, possibly stronger, through the end of the week and into the weekend. Wave heights should be mostly moderate over the course of the week and into the weekend. Another front is expected to pass across the basin into the end of the weekend, with a chance for showers and thunderstorms with this boundary.

ECMWF surface winds, sea-level pressure, and 6-hour precipitation valid 1200 UTC April 18:

**Gulf of Mexico Weather Synopsis - April 18, 2018**

Winds across the Gulf are forecast to be lessening today as the pressure gradient weakens across the region. High pressure will be sliding off to the east as low pressure across the Southern Plains moves towards the region. This low will cause a cold front to move into the basin overnight tonight into tomorrow morning, allowing winds to become northerly and begin to strengthen again. The extreme western Gulf near the coastline should see fresh to some strong winds, while the rest of the basin will experience moderate to fresh winds as this front pushes through. Winds will then remain around fresh, possibly stronger, through the end of the week and into the weekend. Wave heights should be mostly moderate over the course of the week and into the weekend. Another front is expected to pass across the basin into the end of the weekend, with a chance for showers and thunderstorms with this boundary.

ECMWF surface winds, sea-level pressure, and 6-hour precipitation valid 1200 UTC April 18:
