Gulf of Mexico Synopsis - March 20, 2018

A weak cold front pushed through the western Gulf of Mexico during the overnight hours on Monday and into Tuesday with the front pushing offshore the Louisiana Delta this morning. Behind this cold front, winds out of the north-northeast and north are forecast with a fresh to strong breeze. Significant wave heights are expected to build to between 5 to 7 feet with the north-northeasterly winds. Precipitation and thunderstorm chances will remain very low with this front. Throughout the day on Tuesday and into Wednesday, as the front continues to progress, winds will gradually back to the east-northeast and east southeast with high pressure developing in the southern states. By Thursday and into the weekend, a fresh to strong breeze out of the southeast or south-southeast is forecast to prevail with the high pressure along the southeastern coast of the United States. Significant wave heights between 6 to 8 feet will be possible. Into the beginning on next week, the fresh to strong south-southeasterlies to southeasterlies are forecast to continue. Due to high pressure, very low to near zero precipitation and thunderstorm chances are forecast throughout the next few days.

ECMWF surface winds, sea-level pressure, and 6-hour precipitation valid 1200 UTC March 20:
